Chapter 1

README

In this lab work, a graphic editor is implemented using the OLED display, buttons, a switch on the chipkit WiFire Basic I/O Shield board, and data transfer via the SPI interface. Added RTOS. Used 2 tasks to control painting. At the beginning of the program, the text is displayed and the initial coordinates for drawing are set. Using the buttons, you can move 1 pixel up, down, right or left. With the switch, the pixel color is set to black or white.
